Ms. Misty Kaltreider  
Solano County Department of Resource Management  
675 Texas Street, Suite 5500  
Fairfield, California 94533

Subject: **Transmittal of Quarterly Monitoring Report**  
Second Quarter 2005  
Beacon Station No. 3699  
921 Merchant Street, Vacaville, California

Ms. Kaltreider:

At the request of Ultramar Inc. Horizon Environmental Inc. (Horizon) is forwarding the enclosed *Quarterly Groundwater Monitoring Report* dated July 7, 2005. The report documents second quarter 2005 groundwater monitoring at the subject site.

Please call Horizon at 916-939-2170 if you have any questions or require additional information.

Sincerely,  
**HORIZON ENVIRONMENTAL INC.**

# HORIZON ENVIRONMENTAL INC.

Specialists in Site Assessment, Remedial Testing, Design and Operation

July 7, 2005

Mr. Joe Aldridge  
Ultramar Inc.  
685 West Third Street  
Hanford, CA 93230

Subject: **Quarterly Groundwater Monitoring Report**  
Second Quarter 2005  
Former Beacon Station No. 3699  
921 Merchant Street, Vacaville, California

Mr. Aldridge:

Horizon Environmental Inc. (Horizon) has prepared this report documenting results of second quarter 2005 groundwater monitoring at the subject site located in Solano County as shown on Figure 1. There are currently seven groundwater monitoring wells (MW-3 through MW-9) associated with the site as shown on Figure 2.

## **Groundwater Monitoring**

Groundwater monitoring activities were conducted by Doulos Environmental Company (Doulos) on May 5, 2005 according to Ultramar Inc. (Ultramar) Field Procedures (Attachment A). Monitoring activities included measurement of static groundwater level, purging groundwater from the wells, collection of groundwater samples, and preparation and delivery of the samples to the analytical laboratory.

The depth to groundwater in the monitoring wells was measured to the nearest 0.01 foot from the top-of-casing (TOC). The physical parameters of conductivity, pH and temperature were monitored with field instrumentation during the purging process. Field groundwater level and purge data were recorded on the Doulos Groundwater Level Data and Sampling Information Sheets (Attachment B).

Groundwater samples were collected from monitoring wells MW-3 through MW-9 and submitted, under chain-of-custody documentation, to Kiff Analytical LLC (Kiff), a California-certified analytical laboratory (ELAP No. 2236) located in Davis, California. The groundwater samples were analyzed for: total petroleum hydrocarbons as gasoline (TPHg); the volatile aromatic compounds benzene, toluene, ethylbenzene and total xylenes (BTEX); and the fuel oxygenate methyl-t-butyl ether (MTBE) by Environmental Protection Agency (EPA) Method 8260B.

## **Groundwater Monitoring Results**

Depth-to-groundwater measurements were subtracted from the surveyed TOC elevations to calculate groundwater elevations as summarized in Table 1. Groundwater elevation data was used to construct a groundwater elevation contour map (Figure 2).

Groundwater analytical results for TPHg, BTEX and MTBE are summarized in Table 1. The analytical report is contained in Attachment C. Historical groundwater monitoring data are contained in Attachment D.

## **GeoTracker Electronic Data Deliverables**

The analytical electronic data deliverable (EDD) is uploaded by Kiff. The groundwater well measurement EDD (GEO\_WELL) for this quarterly monitoring event has been uploaded by Horizon. The GEO\_WELL file upload confirmation sheet is contained in Attachment E.

## **Recommendations**

Horizon is preparing a Site Closure Request report for this site. Horizon shall recommend that the site be closed as a low-risk groundwater site.

## **Report Distribution**

We recommend a copy of this report be forwarded to:

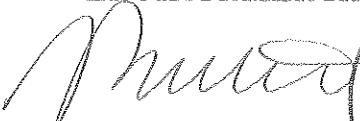

Ms. Misty Kaltreider  
Solano County Department of Resource Management  
675 Texas Street, Suite 5500  
Fairfield, California 94533

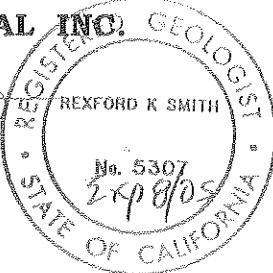

Mr. Jim Barton  
Regional Water Quality Control Board

Notes:

TPHg = total petroleum hydrocarbons as gasoline

MTBE = methyl (tert-butyl) ether

GW = groundwater

TOC = top of casing

msl = mean sea level

< = less than indicated reporting limit

ns = not sampled

nm = not measured

**ATTACHMENT A**

**ULTRAMAR INC. FIELD PROCEDURES**

## **ATTACHMENT A - ULTRAMAR FIELD PROCEDURES**

The following section describes procedures used by field personnel in the performance of ground water sampling at Ultramar Inc. sites.

### **Ground Water Level and Total Depth Determination**

A water level indicator is lowered down the well and a measurement of the depth to water from an established reference point on the casing is taken. The indicator probe is used to sound the bottom of the well and a measurement of the total depth of the well is taken. Both the water level and total depth measurements are taken to the nearest 0.01-foot.

### **Visual Analysis of Ground Water**

Prior to purging and sampling ground water monitoring wells, a water sample is collected from each well for subjective analysis. The visual analysis involves gently lowering a clean, disposable, polyethylene bailer to approximately one-half the bailer length past the water table interface. The bailer is then retrieved, and the sample contained within the bailer is examined for floating product or the appearance of a petroleum product sheen. If measurable free product is noted in the bailer, a water/product interface probe is used to determine the thickness of the free product to the nearest 0.01-foot. The thickness of free product is determined by subtracting the depth to product from the depth to water.

### **Monitoring Well Purging and Sampling**

Monitoring wells are purged by removing approximately four casing volumes of water from the well using a clean disposable bailer or electrical submersible purge pump. Purge volumes are calculated prior to purging. During purging, the temperature, pH, and electric conductivity of the purge water are monitored. The well is considered to be sufficiently purged when: The four casing volumes have been removed; the temperature, pH, and conductivity values have stabilized to within 10% of the initial readings; and the ground water being removed is relatively free of suspended solids. After purging, ground water levels are allowed to stabilize to within 80% of the initial water level reading. A water sample is then collected from each well with a clean, disposable polyethylene bailer. If the well is bailed or pumped dry prior to removing the minimum volume of water, the ground water is allowed to recharge. If the well has recharged to within 80% of the initial depth to water reading within two hours, the well will continue to be purged until the minimum volume of water has been removed. If the well has not recharged to at least 80% of the initial depth to water reading within two hours, the well is considered to contain formation water and a ground water sample is collected. Ground water removed from the well is stored in 55-gallon drums at the site and labeled pending disposal.

In wells where free product is detected, the wells will be bailed to remove the free product. An estimate of the volume of product and water will be recorded. If the free product thickness is reduced to the point where a measurable thickness is no longer present in the well, a ground water sample will be collected. If free product persists throughout the purging process, a final free product thickness measurement will be taken and a ground water sample will not be collected.

Ground water samples are stored in 40-milliliter vials so that air passage through the sample is minimized (to prevent volatilization of the sample). The vial is tilted and filled slowly until an upward convex meniscus forms over the mouth of the vial. The Teflon™ side of the septum (in cap) is then placed against the meniscus, and the cap is screwed on tightly. The sample is then inverted and the bottle is tapped lightly to check for air bubbles. If an air bubble is present in the vial, the cap is removed and more sample is transferred from the bailer. The vial is then resealed and rechecked for air bubbles. The sample is then appropriately labeled and stored on ice from the time of collection through the time of delivery to the laboratory. The Chain-of-Custody form is completed to ensure sample integrity. Ground water samples are transported to a state-certified laboratory and analyzed within the U.S. Environmental Protection Agency-specified hold times for the specified analytes.

**ANALYTICAL REPORT**

Report Number : 43660

Date : 5/11/2005

Rex Smith  
Horizon Environmental  
4970 Windplay Drive, Suite 5  
El Dorado Hills, CA 95762

Subject : 5 Water Samples  
Project Name : Beacon  
Project Number : 3699 Vacaville  
P.O. Number : 3699-75

Dear Mr. Smith,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed.

Kiff Analytical is certified by the State of California (# 2236). If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

A handwritten signature in black ink. The signature appears to read "Joel Kiff" and is enclosed within a roughly circular outline.

NOTES:

- <sup>1</sup> Measurement and reference elevation taken from notch/mark on top north side of well casing.
- <sup>2</sup> Elevation referenced to arbitrary point on site, assumed elevation 100.00 feet.
- Well Depth      <sup>3</sup> Measurement from top of casing to bottom of well.
